

PSD2, SCA, WTF?

What to expect from the EU legislation

Kelley Robinson

Assumptions

1. Your users have something of value connected to an account

Assumptions

2. A user can only access the value once they are authenticated

Assumptions

3. A successful impersonator could also access that value

Account Takeover Fraud Hits Record High, Nearly Triples in 12 Months

 **\$5.1B** 
In 2017

PSD2

Payment Services Directive 2

The original PSD (2007)

- Objective: create a single market for modern payment services in the EU
- Add consumer protections
- Paved the way for new payment disruptors

Paysafe:

TransferWise

Klarna.

What is PSD2? (2015)

- Updated regulations governing payment service providers in the European Union
- Applies to card not present (online) transactions
- Increase safety of cross-border payments

What's new in 2019?

Strong customer authentication (SCA)
for **all purchases over €30**

Scenarios where SCA applies:

The payer...

A Accesses its payment account online

B Initiates an electronic payment transaction

C Carries out any [risky] action through a remote channel

AUTHENTICATION FACTORS

Two are required to achieve SCA

INHERENCE

BIOMETRIC

POSSESSION

MOBILE PHONE

KNOWLEDGE

PASSWORD

Beginning **14 September 2019**, non-compliant payments that require SCA will be **declined**.

Dynamic Linking Explained

Dynamic Linking Explained

- Each transaction must have a **unique authentication code**
- Specific to the **transaction amount** and **recipient**
- Both amount and recipient are **shown to payer**

Use code 312568 to approve your Flourish and Blotts transaction of €713.00 to Gilderoy Lockhart

Dynamic Linking Security Requirements

**(a) the payer is made aware of the
amount of the payment transaction
and of the payee;**

(a) the payer is made aware of the
amount of the payment transaction
and of the payee;

Ensure the **user is confident** they are
authenticating the right transaction.

**(b) the authentication code
generated is specific to the amount
of the payment transaction
and the payee agreed to by the payer
when initiating the transaction;**

(b) the authentication code
generated is specific to the amount
of the payment transaction

Any code must be used for
that specific transaction only.

(c) the authentication code accepted by the payment service provider corresponds to the original specific amount of the payment transaction and to the identity of the payee agreed to by the payer;

(c) the authentication code accepted by the payment service provider corresponds to the original specific amount

Once a valid code is accepted, **other channel codes are invalidated.**

(d) any change to the amount or the payee results in the invalidation of the authentication code generated.

(d) any change to the amount or the payee results in the invalidation of the authentication code generated.

If transaction details change, **invalidate all outstanding codes.**

How to Implement SCA

SMS

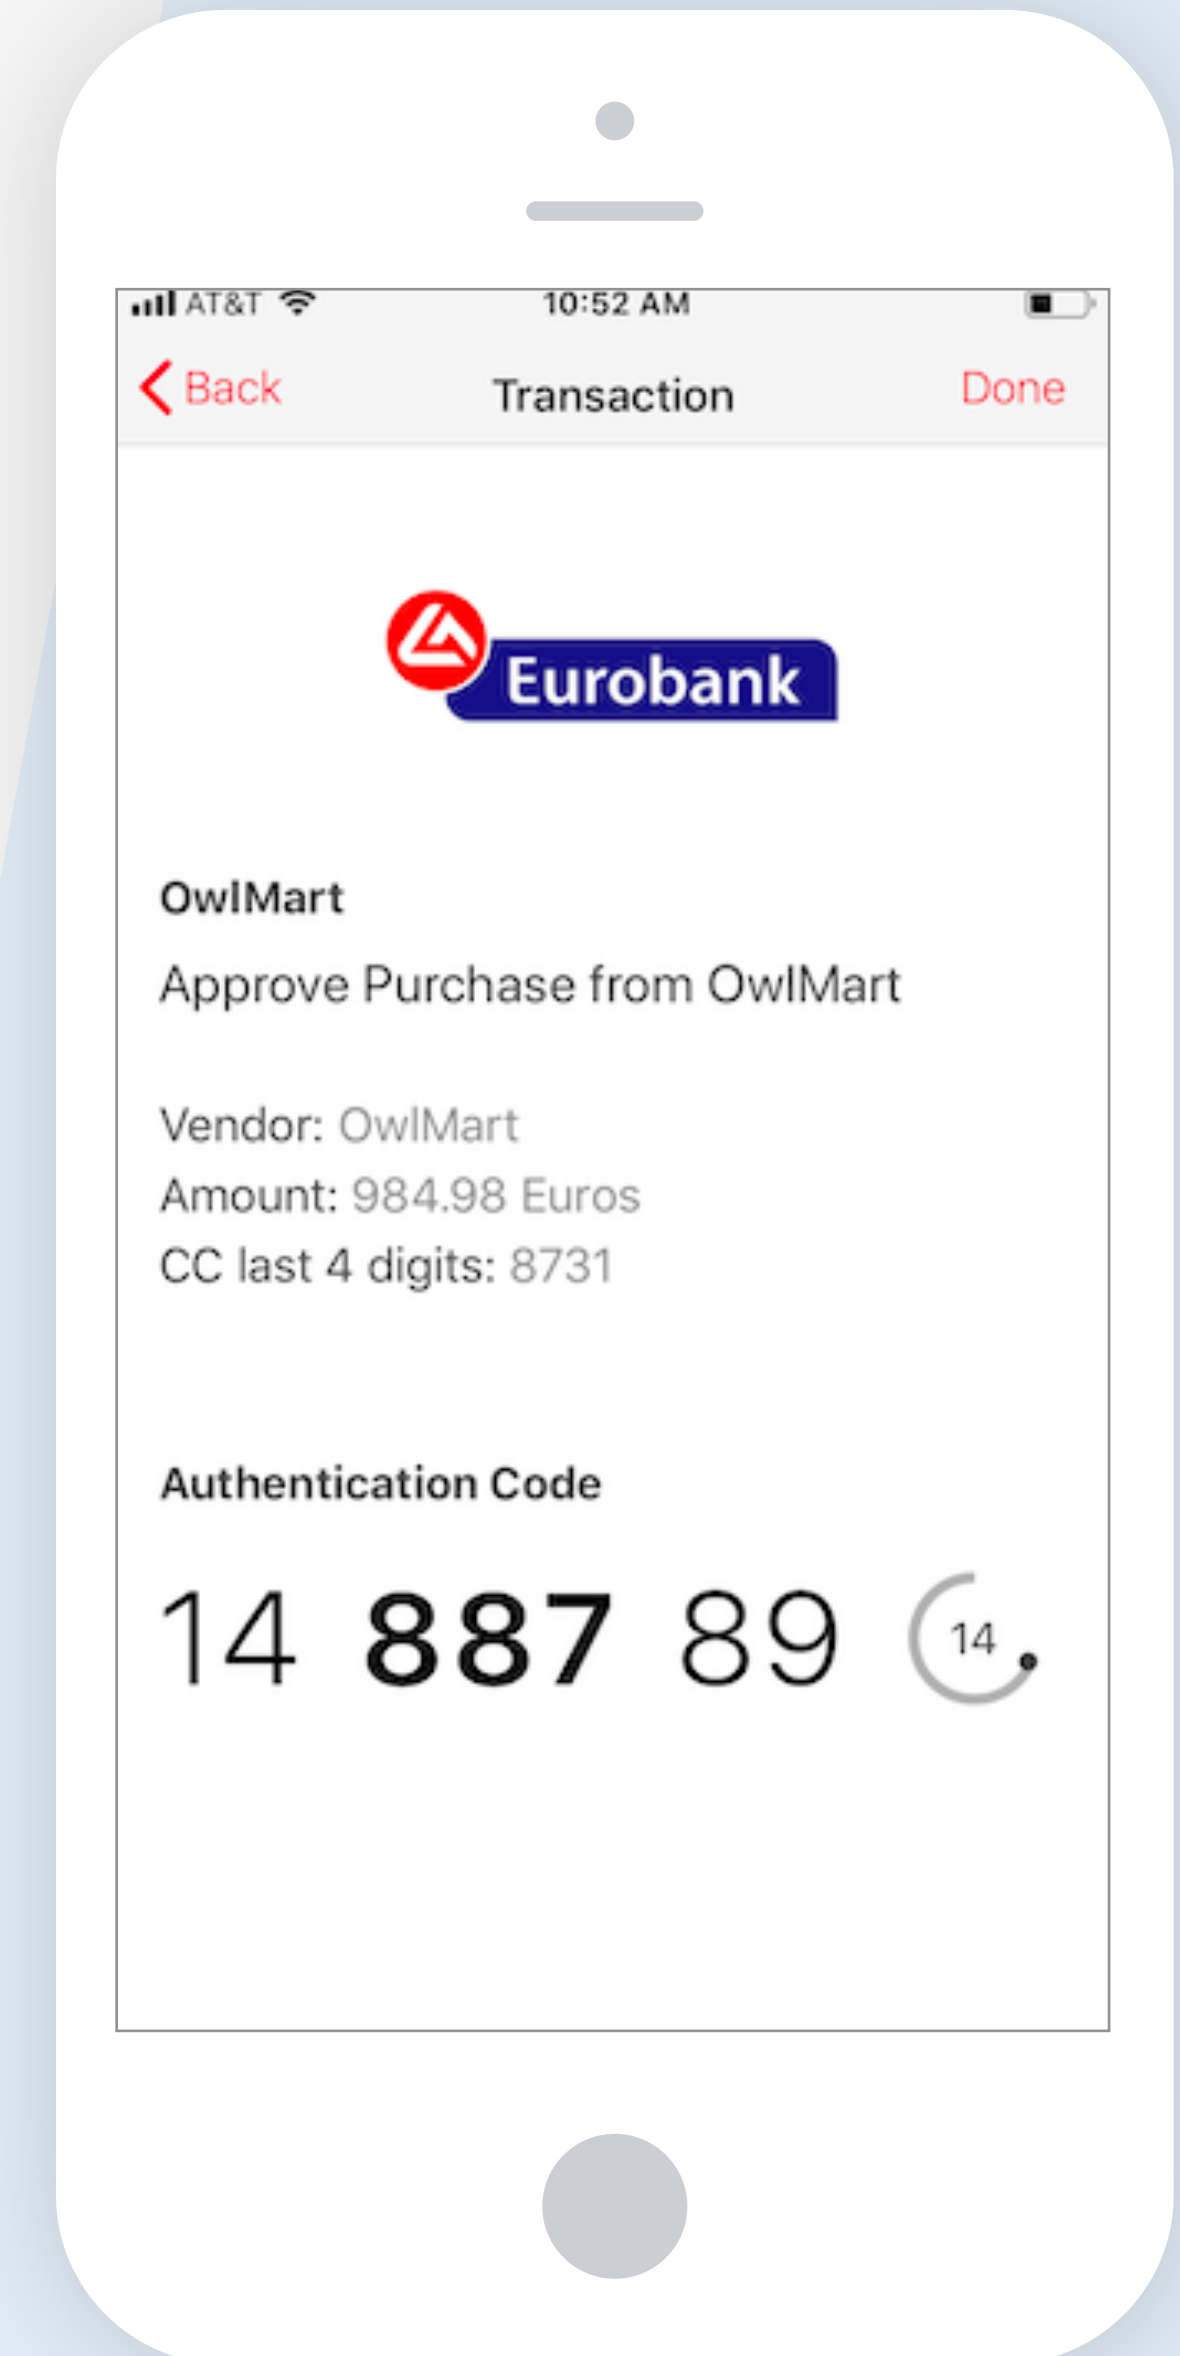

- No app install required
- Easily include transaction info in the message body
- Vulnerable to phishing & man in the middle attacks

Use code 312568 to approve your Flourish and Blotts transaction of €713.00 to Gilderoy Lockhart

Transactional TOTP

- Requires Authy
- Works offline
- Based on the Time-based One-time Passwords RFC 6238 standard
- More secure than SMS

Push Authorization

- Requires a special app (or SDK + dev work)
- Cryptographically most secure
- Seamless user experience
- Easily customize with your brand

Research groups **recommend push-based authentication over SMS** because of the secure connection between the retailer, the 2FA service, and the device, **removing opportunities for phishing.**

Security = Friction

Friction = Abandoned carts

Time is money

- Slow transactions may lead to fewer sales
- Offer options (+retries) to keep customers happy

What next?

- Are you a payment service provider?
- Does your PSP already provide a solution?
- Do you need to build your own solution?
